

# Spotify Open Recommendation Engine

## Working Prototype Known Problems Report | Team Spotify Squad

Release: v.1 | 30 November 2021

---

### List of functions not working correctly:

- **Problem 1:**

- Cause of failure: (input/action): The user's Spotify account must be added to the developer console before using the application
- Location of fault: Spotify Developer Console
- Possible action to remove fault: Submit a Quota Extension request through Spotify to allow more users to access the application

- **Problem 2:**

- Cause of failure: (input/action): When wanting to change accounts, after having logged in then logged out to change the account, the user is automatically signed into the old account they were using without being presented with the option to use a new account.
- Location of fault: Our Spotify authentication module
- Possible action to remove fault: Since the access token for the account is stored in the session , when logging out we need to clear the entry in the session.
